

# Chains

# BASICS ON CHAINS

Chains are used in a wide variety of applications in industry and agriculture, to transmit mechanical power. Our program comprises Roller chains and chains other than Roller chains used basically to convey movement, power or load.

The largest share of our program is the Roller chain, a kind of chain composed of an outer and an inner plate, pin, bush, roller and a plate fixing element, namely cotter pin, spring clip, T pin or cotter hook.

The key elements of a Roller Chain as pitch, width, roller type, side plates and others are recollect in form of Standards.

The chain transmits the rotational power from an sprocket to tension power which in turn, converts it to rotational power into another sprocket thus the pair chain-sprocket share technical aspects which are associated to both. Along the catalog, appear comments relating the part.

## ROLLER CHAIN STANDARDS

The standards ASME/ANSI are used in USA, while in Europe the standard used is the BS/DIN/ISO and the JIS in Japan. These standards have similarities but are not coincident thus a careful attention

on interchangeability must be taken.

These are the basic Standards used by major Roller Chains.

Standard			
TYPE OF CHAIN	ANSI	ISO	JIS
Power Transmission Roller Chain	ANSI B 29.1M	ISO 606	JIS B 1801
Power Transmission Bushed Chain	ANSI B 29.1M	ISO 1395	JIS B 1801
Power Transmission Sprocket	ANSI B 29.1M	ISO 606	JIS B 1802
Heavy-Duty Chain	ANSI B 29.1M	ISO 3512	
Bicycle Chain		ISO 9633	JIS D 9417
Motorcycle Chain		ISO 10190	JCAS 1
Leaf Chain	ANSI B 29.8M	ISO 4347	JIS B 1804
Double Pitch Conveyor Chain & Sprocket	ANSI B 29.4	ISO 1275	JIS B 1803
Power Transmission Roller Chain with Attachment	ANSI B 29.5		JIS B 1801
Conveyor Chain	ANSI B 29.15	ISO 1977/1 @ 3	JCAS *2

\* JCAS stands for Japanese Chain Association Standard.

### ANSI Roller Chain Standards

They establish 14 sizes, coded in two and three digits, namely, 25, 35, 41, 40, 50, 60, 80, 100, 120, 140, 160, 180, 200 and 240 (*See at the Sprockets section the same correlated digit system to identify the sprocket-chain match*).

The first digit up to the 80 code or the first two thereafter, indicate the pitch of the chain expressed in eighths of an inch, thus a chain 40 corresponds to a 1/2" pitch roller chain and a 160 is a two inch-pitch roller chain.

The chain 41 is a lightweight chain while it has the same 1/2" pitch

than the 40, the rest of features are different as the roller width, the roller diameter, the plate height and thickness and tensile strength. The 41 chain fits to a 41 sprocket while the 40 it is too wide for the 41 sprocket.

The digit 5 on the right-hand of the chain reference corresponds to chains without rollers, that is, bushing chains.

A hyphenated number following the chain reference, indicates the number of strands and there may be complementary digits indicating special features of the material or finish.

### ISO/BS/DIN Roller Chain Standards

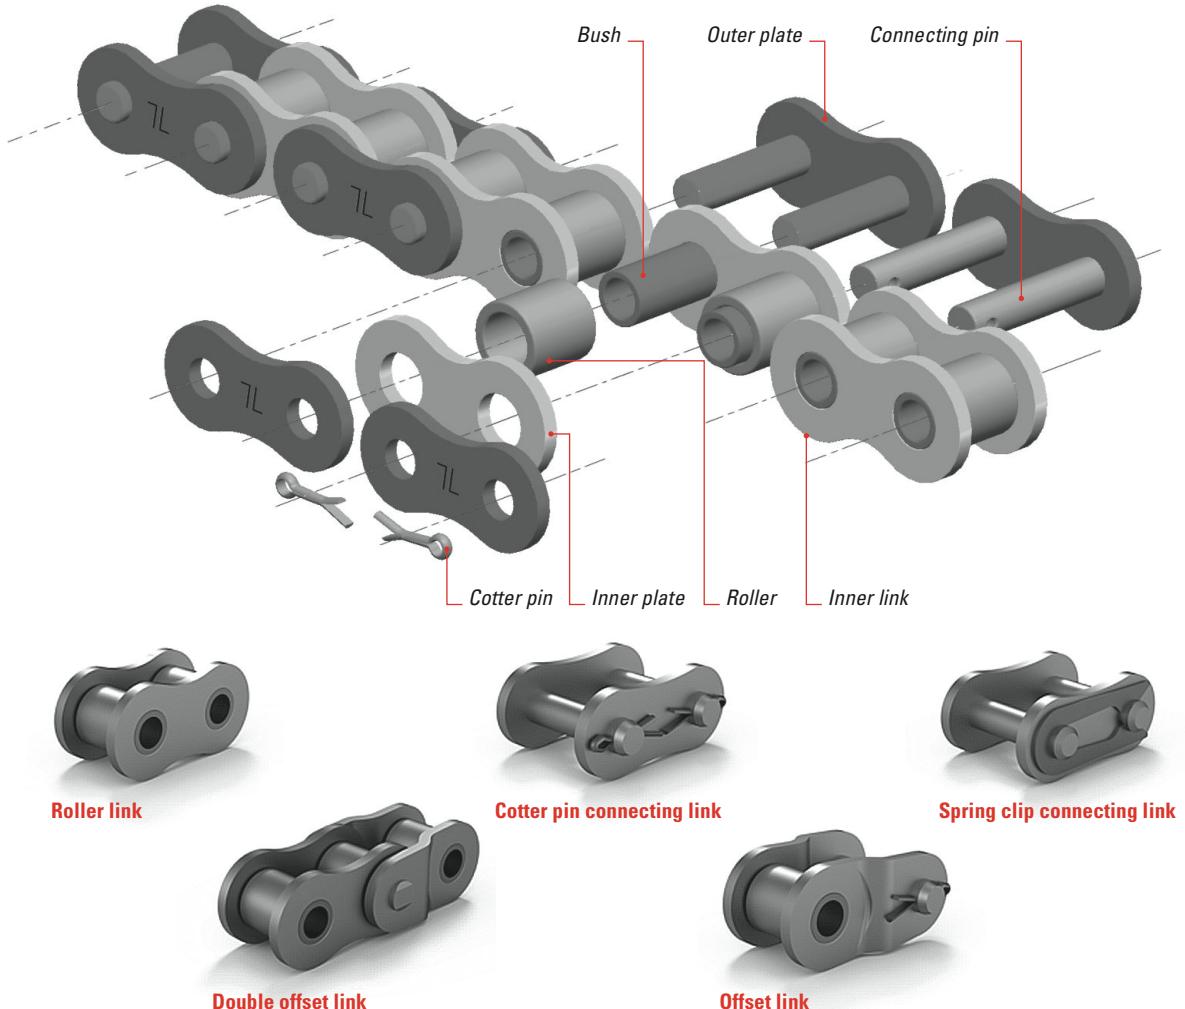

They conform to the ISO 606 standard and are not interchangeable with the ANSI roller chain. Used in most European and African countries. The outer plates of an ISO roller chain are taken from the chain size one level above the application, what makes a heavier chain. The standard comprehends single, double and triple strands.

The nomenclature is composed of two digits indicating the pitch expressed in sixteenths of an inch followed by the digit B which indica-

ted the adherence to European standard.

The standard establishes the sizes 04B, 05B, 06B, 08B, 10B, 12B, 16B, 20B, 24B, 28B and 32B. A chain 10B indicates a metric roller chain of 5/8" pitch. A hyphen and a digit indicated the number of strands.

The power ratings of the ISO/BS/DIN chains are slightly lower than those of the equivalent ANSI chains.

## ROLLER CHAIN TECHNICAL CONSIDERATIONS

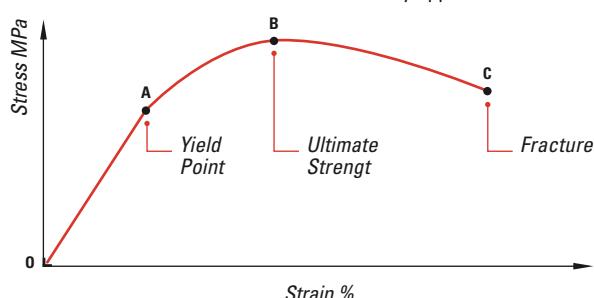

We consider first the behaviour of the **Chain under stress**, the **Elements of the chain**, **Driving conditions** and the **Manufacturing process**.

### Chain under stress

#### Tensile strength

It is not to be confused with tensile stress which is the load applied to a chain divided by the resisting surface expressed in MPa while the tensile strength is the maximum force or load, which keeps the chain under tension, the chain can bear before it fails.

The tensile strength of a chain is reported with the recollection of data of stress measure in MPa and the strain or elongation, measures in percentage composing a stress-strain curve-graph where the different phases of the behaviour of the chain under stress are clearly appreciated.

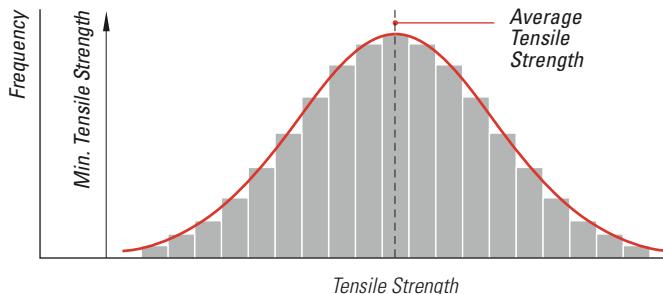

The phase starting at the point 0 to A is the proportional or elastic phase where the chain strain is reversible, that is, the deformation of the chain caused by the stress returns to the original undeformed state. This phase is also known where the proportional phase as the strain or elongation is proportional to the stress applied.

The point A, in the stress-strain named as the Yield point marks the limit of the elastic proportional phase and starts the plastic phase, A to B where the chain behaviour would experiment a strain which would not be reversible but permanent.

## Tensile strength

With the increase of the stress and the strain, the point B, the Ultimate Tensile Strength represents the maximum stress that a material can bear before failure which occurs at the point C with its breakage.

The Minimum Tensile Strength is the minimum stress applied to a chain in which a chain may fail. This value is to be found and determined statistically from a pool of experimental data obtained by testing as the Average Tensile Strength, the center of the frequency graph displayed below.

With a chain, the maximum load it can bear without losing its capacity is far below the point A, around a 70% of the Ultimate Tensile Strength and in no circumstance a chain is to work a stress beyond point A as a permanent deformation would occur.

As a general practice the maximum stress a chain could be submitted

to is half of the Average Tensile Strength, beyond this point fatigue will result and ultimately the failure.

In the chain's data tables we disclose the Average Tensile Strength and the Minimum Tensile Strength.

## Chain wear and elongation

Although chains may be used purely for pulling, most of the chains are used as driving chains by wrapping sprockets with the interaction of the chain roller and sprocket's teeth by producing the back tension in the chain.

In operation, there is an amount of friction between the bush and the pin which, although it may be minimized by lubrication, makes the pin to wear and thus elongating the chain and, at the end producing fatigue.

The stretch produced by wear provokes the chain to inch up the sprocket's teeth and ultimately jump the sprocket.

The regular and proper lubrication of the pin and bushing reduces the wear, though many other factors are concomitant as the adequacy and quality of the materials used in the construction of the chain, the manufacturing process, the treatments undertaken and assembly of the chain.

The effect of the lubrication on chain elongation is clearly reflected in the next graph, where the different curve locus reflect the behaviour of chain lubrication situations in terms of operating time and chain elongation.

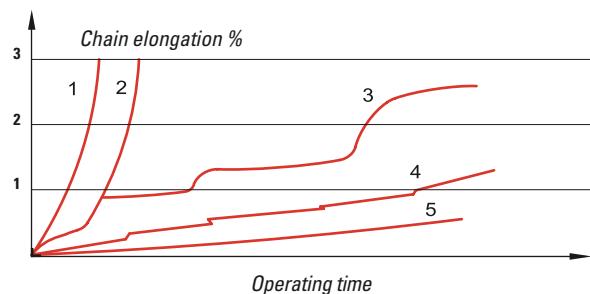

**Locus 1:** No lubrication. The chain wears out very fast

**Locus 2:** Initial lubrication only. The wear starts as soon as the initial lubrication has been used up

**Locus 3:** Not periodic lubrication. The chain wears after each interval lubricating interval. The lubrication frequency is not properly implemented.

**Locus 4:** Irregular chain wear due to incorrect lubrication

**Locus 5:** Correct lubrication. The wear follows a predictable pattern.

As a guide, it is considered that driving roller chains with a wear stretch further than 1,5 percent are out of use, or 2 percent stretch in conveyor chains given their lesser number of working teeth.

## Chordal effect

Mentioned in the Sprockets, Chapter I page number I3 of this catalog, may affect to the smoothness of the drive. As the driving sprocket is usually the smallest of the pair it is recommended not to use sprockets under 12 teeth so to minimize the chordal effect created

by chain rise and fall as each pitch engages and disengages, submitting the chain to a speed pulsation. The use of bigger sprockets minimize this effect.

# Elements of the chain

## Pin

The pin is submitted to shear and bend transmitted from the plate. Together with the bushing contributes to bear the load and in consequence needs high tensile strength, shear strength, resistance to bending and a capacity to absorb irregular impact loads. These conform the material to be used, the manufacturing process, the surface finish as well as the treatment.

## Bushing

As well as the pin, the forces acting on the bush are shearing and bending forces, transmitted from the roller and the plate and as well receives shock loads from the engagement of the sprocket.

The main forces to resist by the bush are the shearing, shock loads from the roller and wear, the outer surface from the roller and the inner surface from the pin.

## Roller

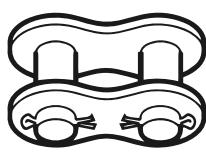

The roller suffers impact loads from the sprocket surface every time a tooth of the sprocket engages the chain plus the compression force acting from the sprocket surface. It rotates, thus there is a wear action between the roller and the bush, while at the same time creeps up to the tooth receiving a compression force. All composed, the roller has to stand up to inside and outside wear plus to external compression.

## Connecting links

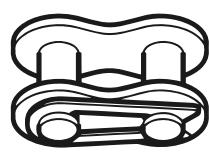

To join the ends of the chain, a connecting link is the most common component. There are two configurations available, namely the connecting link with open spring clip and the cotter pin, both slip-fit.

The short pitch chains normally use two connecting pins riveted into the outer plate while the slip-fit cover plate is secured by a spring clip. The alternative configuration consists as well of two connecting pins riveted into the outer plate, while the slip-fit cover plate is secured by a cotter or split pin. For big load carrying, press-fit connecting links are recommended, in which case the cover plate pitch holes are smaller in diameter than the pins, thus requiring to press the cover plate onto the pins before fixing a spring clip or a cotter pin.

Press-fit connecting link cover plates can carry bigger load than the slip-fit, and are possible to install by pressing the cover plate, with a smaller diameter than that of the pins, onto the pins before mounting the cotter pins or the open spring clip.

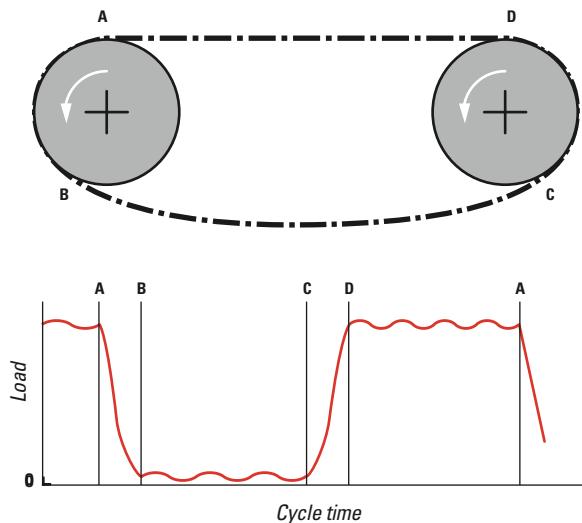

Cotter pin

Spring clip

## Plate

The plate has to bear the tension of the chain in cycles, whereas the maximum tension is between the driving and driven tract of the chain drive, it decreases along the descending sprocket wrap, stays minimum between the driving and driven returning tract and picks up in the ascending wrap as shown in the graf below.

The plate then has to stand up to traction tensile strength plus the shock loads, corrosion and abrasion.

## Cotter pin and Spring clip

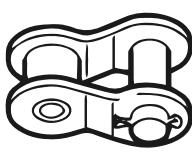

Their function is to keep in place the outer plate to fall off. They have to be of high tensile steel.

## Offset links

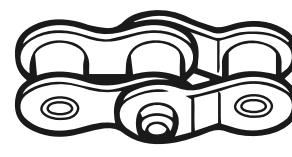

Known as well as cranked links, not to be confused with the the crank links used as a main feature of the Crank Chains included in our program, are used in cases where the chain has to have an odd number of links, as the chain to join has an even number of links. It is known as well as a half link for the sake to be used to shorten the chain.

A Single-pitch offset link consists of a pair of cranked plates with a bush and roller at the narrow side and slip-fit with split pins at the wide side of the link. Of important consideration to note that Single-pitch offset links can reduce the load capacity of the chain up to 30%.

A Double-pitch offset link consists of an inner link press-fit assembled with an offset link offers higher structural strength, thus far more reliable in high speed or heavy loads than the Single-pitch offset link. The Double-pitch offset link does not provoke a significant reduction of the load carrying capacity of the chain.

Half link

Double link

# Driving conditions

## Strength effect to chain bewteen Connecting links and Offset links

Connecting and Offset links have a lower fatigue strength than the chain as a whole, consequently the decrease in the strength chain ratio has to be taken into consideration at the time of configuring a chain.

The table ahead is a guide of the average strength decrease in percentage of the Maximum Load Allowance. To minimize this effect, there is the possibility to configurate a chain as an endless unit in which case the links will be press fit, either by riveting or any other factory-made system.

TYPE OF LINK	STRENGTH REDUCTION IN %
Slip fit connecting link	0 ~ 20
Press fit connecting link	No reduction
Slip fit offset link	30 ~ 35
Two-Pitch offset link	0 ~ 25*

\* Minimum for press fit. Maximum for slip fit.

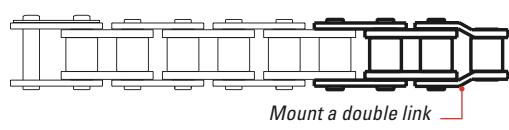

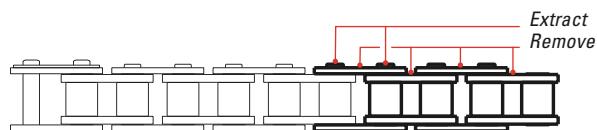

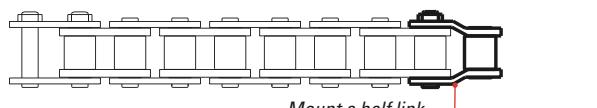

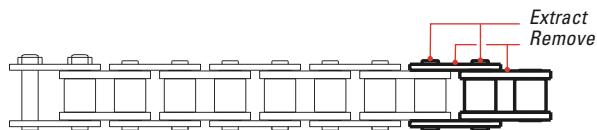

## Chain length adjustment

In case that the distance between driving and driven shafts is fixed, the length of the chain has to be adjusted with the use of links:

### Shortening by one pitch:

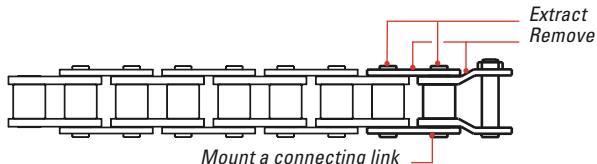

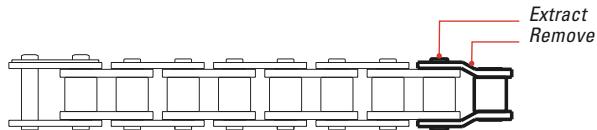

#### A. Chains with an even number of pitches:

Remove two pitches, that is, one inner and one outer, add then an offset link. Alternatively, remove four pitches, two inners and twoouters, add then one double offset link.

#### B. Chains with an odd number of pitches

Remove the crank link at the end of the chain. Alternatively, if the chain ends with an offset link used as connectin link, remove the outer link and replace by a connectin link.

## \*Hardened Teeth

Case hardening the teeth of the sprockets usually by induction, provides at their wearing areas a hard layer,which contributes to the reduction of wear, as well as absorbs shock loads, while maintains the ductility of the core.

Although the general guide of chain technique advises to harden the teeth in sprockets less than 25 teeth due to the fact that the load in teeth increases as the number of teeth decreases, the sprockets of our program are hundred percent hardened teeth.

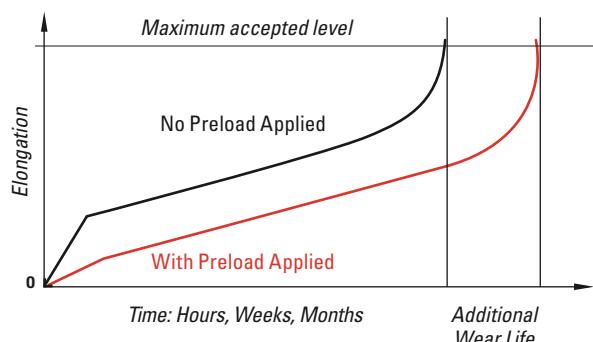

\* Reproduced in Chapter I page: I5

## Preloading

Consists in applying to the chain, a load near to the maximum while in service, aligning the chain components and eliminating the initial elongation with the result of longer serviceability of the chain.

The graph below shows the result of preloading in terms of serviceability. Chains not preloaded experiment an amount of elongation at the start and will further elongates as compared with the preloaded which practically does not elongate at the start and, at the end extends its life.

The preload graphic below makes clear the benefits of the preloading in terms of longer wear life.

Every chain in our program is statically and dynamically preloaded.

## Chain Wrap

The minimum wrap angle guide is 120° in the smallest sprocket of the drive which may be reduced with a proper tension of the chain, otherwise the chain may jump out.

## Manufacturing process

Our chain's program is manufactured by modern equipment constantly adapted to the latest techniques of the world industry oriented to the quality of the product, starting with the different steel materials, the making of the components, the treatments, the assembly and the final testing at the end.

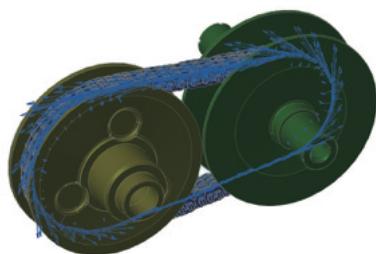

A quality assurance program monitors the chain making all along the different phases and stations in view to guarantee the expected Performance, Reliability and Durability in conformance to the design of the specific chain.

The plant counts with specialized equipment as, but not limited to, cold roller extruders, continuous rolling of plate strips, low speed

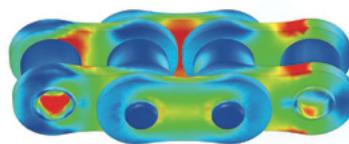

wire cutting units, continuous mesh rolling of bush material, shot blasting line, continuous mesh bolt furnace and assembly line, with the corresponding tooling.

A fully equipped metrology lab and testing equipment guarantee the quality dimensions of the chain. Amongst others, the lab counts on, chain length measuring, 3D measuring instruments, spectrometer, saline tester, roughness contourgraph, wear tester and strength-strain tester.

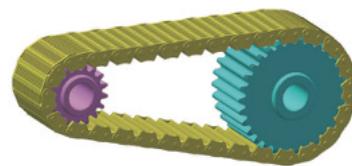

Mention has to be done to our capacity to customize the product according to specific needs of the customer.

Dynamics modeling and simulation analysis

FEA, Finite Element Analysis

System design

Environmentally friendly shot blasting line for plate material

Cold extruding of rollery

Continuous rolling of bush material

Continuous meshbelt furnace

# CHAIN PROGRAM

Our chain program is grouped in:

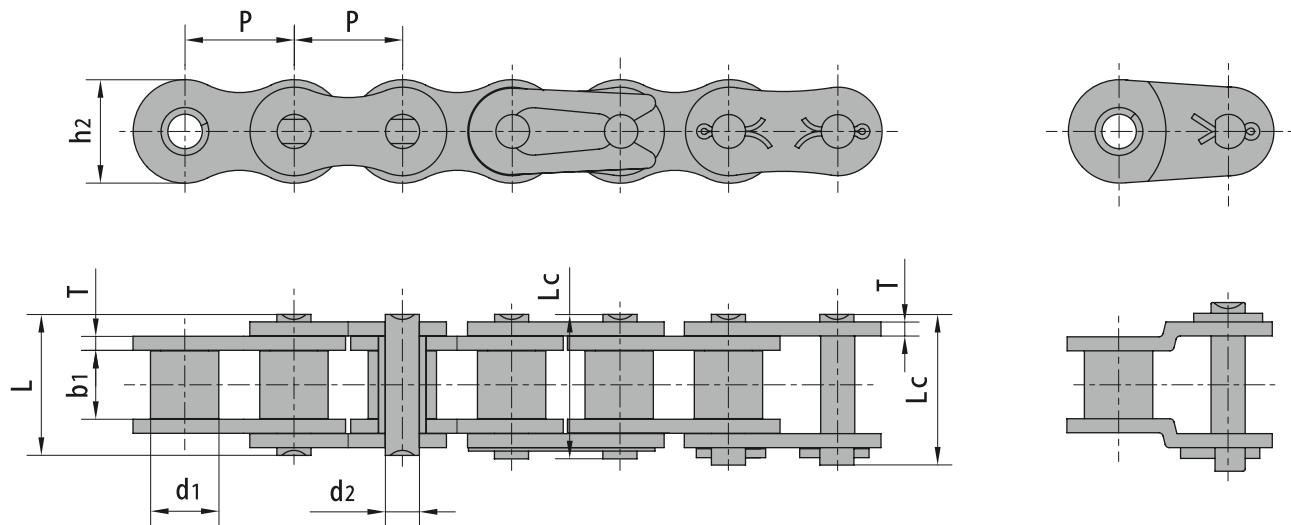

- **Driving chains**
- **Conveyor chains**
- **Stainless Steel chains**
- **Engineering chains**
- **Leaf & Hoisting chains**
- **Agricultural chains**
- **Automotive chains**
- **Drag chains**
- **Accessories**

## COMBINE CHAINS-REPLACING PARTS

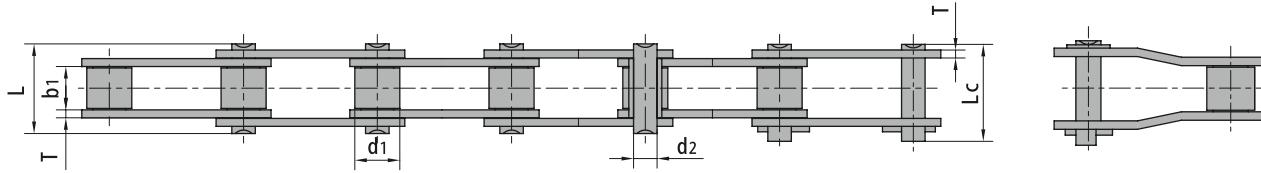

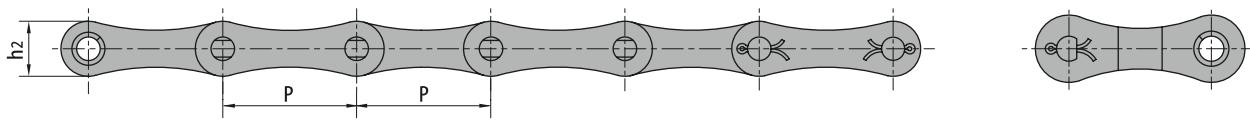

We have a comprehensive program of replacement chains for combines, namely feeder and elevator chains suitable for major brands

in the market. For information, please contact our commercial service.

# DRAG CHAINS

This range comprehends different types of chains of wide use in handling applications of the industry. The models we present are of different materials as steel casting, ductile casting, drop forging, different manufacturing process as welded chains, rivet less chains, detachable chains, different heat treatments and a wide choice of attachments to make up nearly every configuration a customer may need in the field of handling operations. An MTO service for those special applications not standardized it is also possible.

Our drag chains program is composed of:

- Double flex chains
- Block chains
- Scraper chains
- Drop forged scraper chain
- Drop forged rivetless chain
- Trolley
- Pusher dog
- Sugar industry chains: Main Cane & Auxiliar carrier chains. Diffuser chains
- Casting chains
- Detachable chains
- Welded chains

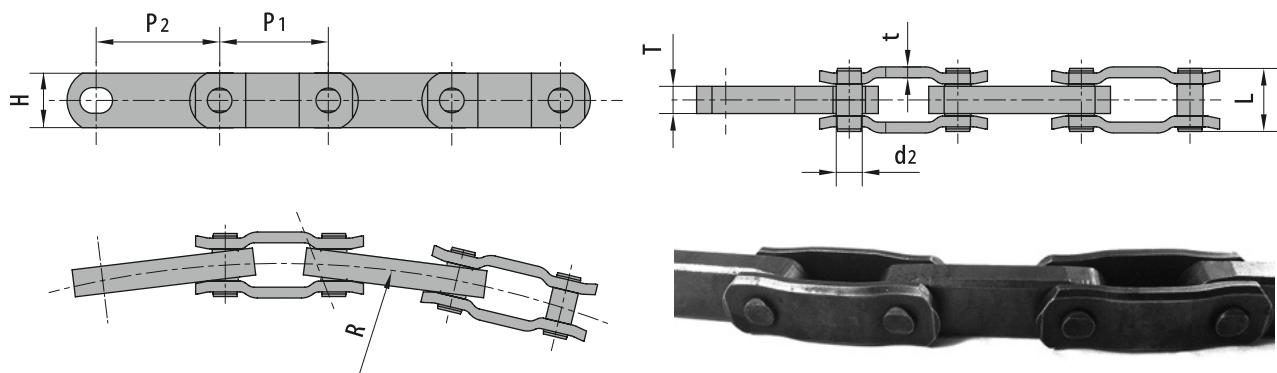

## DOUBLE FLEX CHAIN

The steel TL-3500 model it may operate in both directions which combined with the ability to flex in two planes it makes it very useful in handling applications. The block link is beveled to protect weak conveyed units. The curved side-plate profiles shield and protect

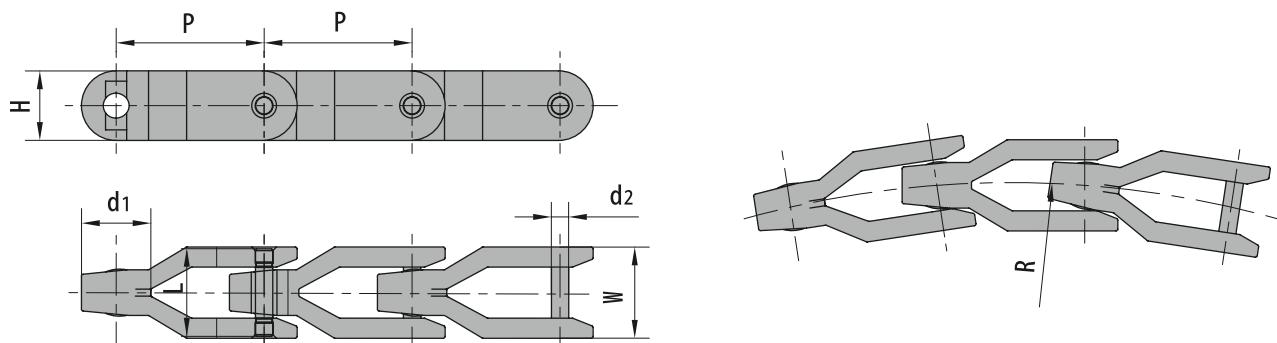

the rivet ends. Allows a side bow radius of 500 mm (20").

The Cast TL-CC1400 model has as well an ability to flex in two planes allowing a side bow radius of 500 mm (20").

# BLOCK CHAINS

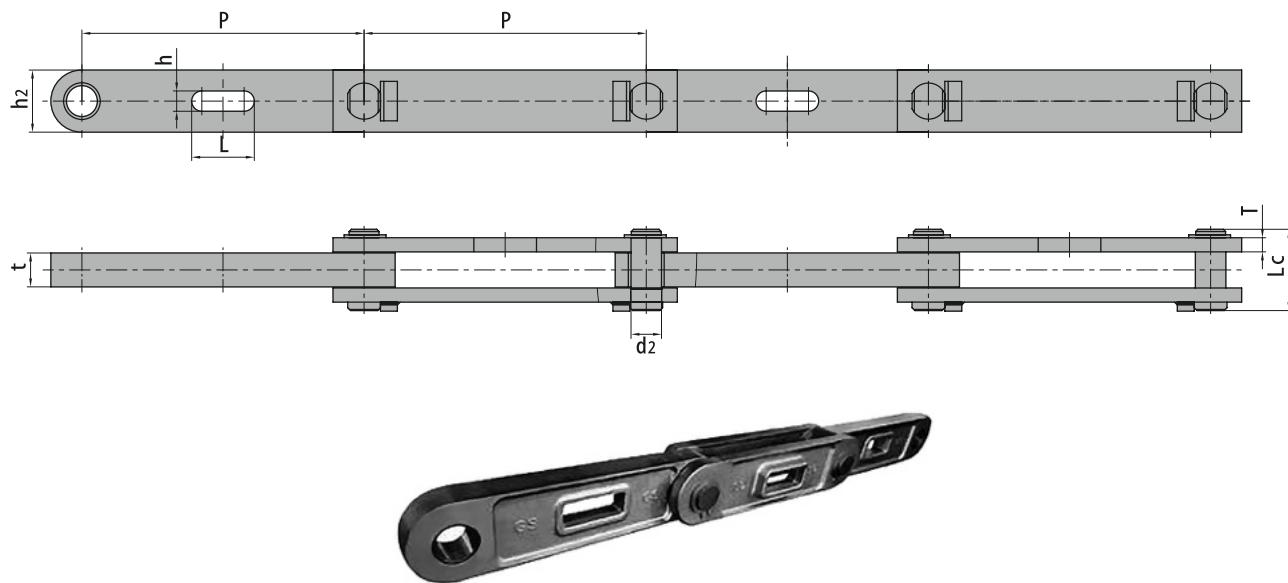

Used mainly in the steel industry in conveying steel bars, tubes for cooling or pushing billets and slabs in steel plants. Used as well in vertical conveyance of arids.

This type of chain consists of a solid center link, the block sandwiched between outer link plates held by high strength steel pins. The design as described has a high carrying area.

# DROP FORGED SCRAPER CHAINS

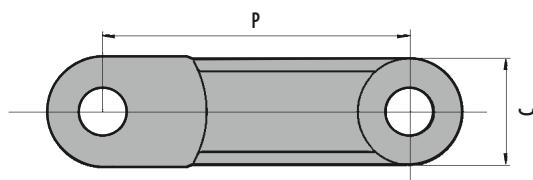

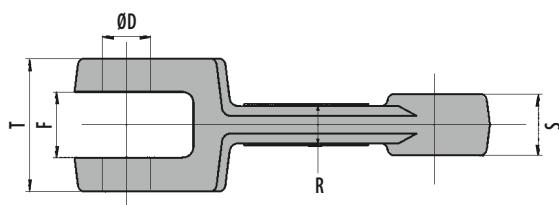

Used mainly for the conveyance of different products either dusty or heavy bulk, as clinker, coal, cement, ashes, gravels, waste, grains and many others.

We offer two types of links, either single or double with a wing wheel to fix a choice of attachments according the specific application

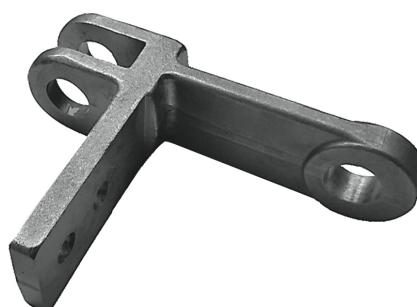

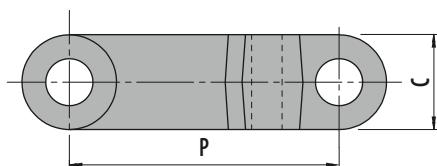

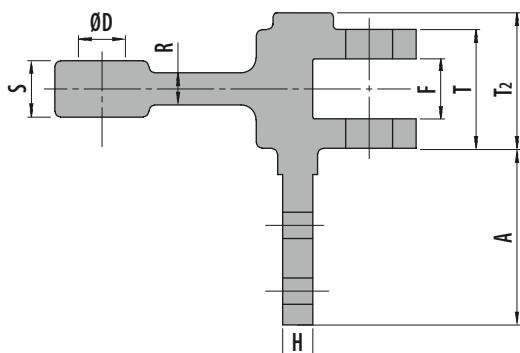

as scrapers, buckets and others as well as non standard, under MTO according customer's application.

A version for double strand assembly is available by means of a clevis wing where to mount an scraper secured by a pair of bolt and nuts.

# DROP FORGED RIVETLESS SCRAPER CHAINS

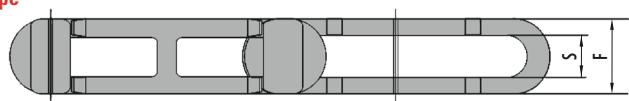

Of a very simple and robust construction, it makes a very interesting choice for overhead trolleys, scrapers and conveyors. Two series are available, the standard and the X series, being the latter bi-directional

in the sense that it flexes in two planes. Made under the standard ANSI/ASME B29.22-2001 covering Drop Forged Rivetless Chains, Sprocket Teeth Drive Chain / Drive Dogs.

## CASTING CHAINS

Intended primarily for the gas bottling industry, and specifically for LPG, (Liquified Petroleum Gas) is made out of ductile casting with steel pins, which can be fixed or detachable, improving the mounting and dismounting. These chains are very flexible making them very versatile to apply in different handling applications other than handling gas bottles. They may be called LPG chains.

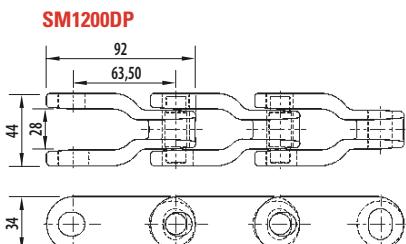

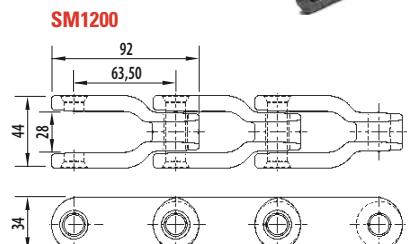

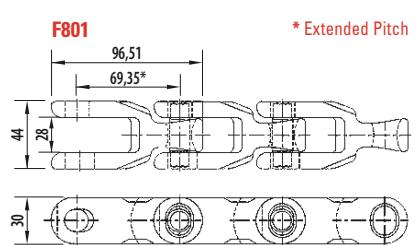

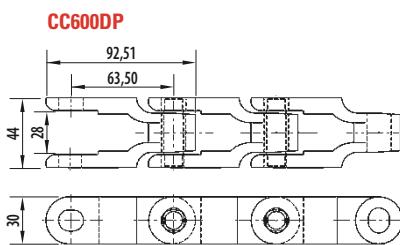

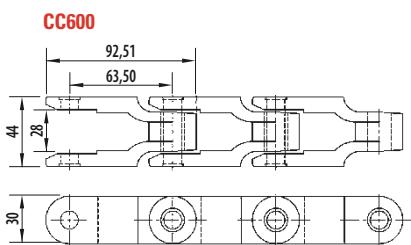

Our program of casting chains, with the matching sprockets, covers

fixed and detachable pins with a choice of different pitches.

The main traits of significance is the wide top and bottom surface, pin flush ends and easy pin changing.

In explosive environments it is recommended to use Polyethilene of Ultra high molecular weight as low friction liners, increasing the safety, decreasing the noise and increasing the chain wear life.

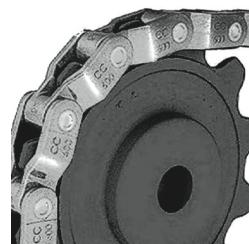

Here is our program:

REFERENCE*	PITCH	MOUTH OUTER WIDTH	MOUTH INNER WIDTH	HEIGHT	SIDE BEND	ULTIMATE STRENGTH	WEIGHT
					radii	Kgf	Kg/m

\* All measures in mm unless otherwise indicated

See the matching sprockets in page I158.

Sprocket with casting chain CC600

## STEEL DETACHABLE CHAINS

Widely used in agricultural and industrial applications with moderate loads and speeds. Very easy to install and repair as well, an easy assembling and disassembling.

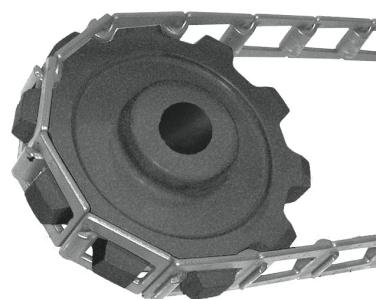

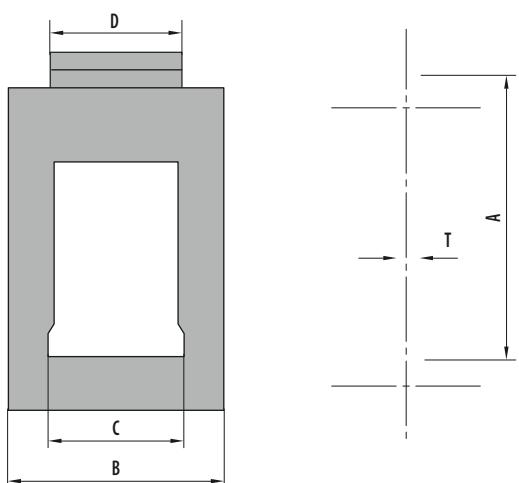

We have a selection of attachments for different applications: The chain can be delivered in lengths according customer's configuration or in single links.

CHAIN SIZE	DIMENSION INCH					TENSILE STRENGTH LBS

Manure Spreader with Detachable chains and pushing bars

See the driving sprocket in pages I159 to I161.

# WELDED CHAINS

Of simple and sturdy construction this range of chains are used to convey and drag a wide variety of materials amongst but not limited to, logs, elevators, chips, plywood and scraps in general.

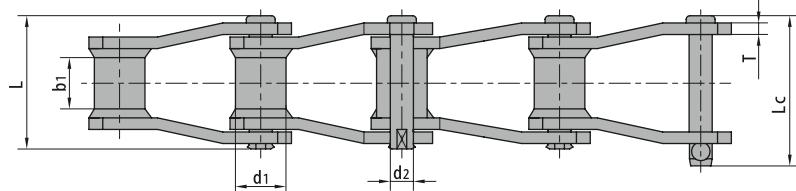

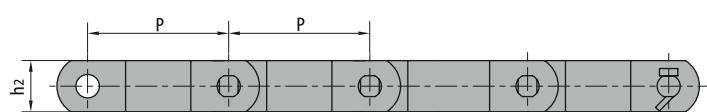

Our program has two series, the narrow and the wide series.

The construction of the narrow series consists of two offset plates, a bush welded all around with the plate and a heavy press fit pin. The models WR have the pins and bushes heat treated while the models WH are heat treated in all its components, that is, side plates, bush and pins.

An ample choice of convenient attachments makes this range very adaptable to the customer's applications in different activities as forest, bulk product handling, clinker dragging, sugar and fertilizer plants and others.

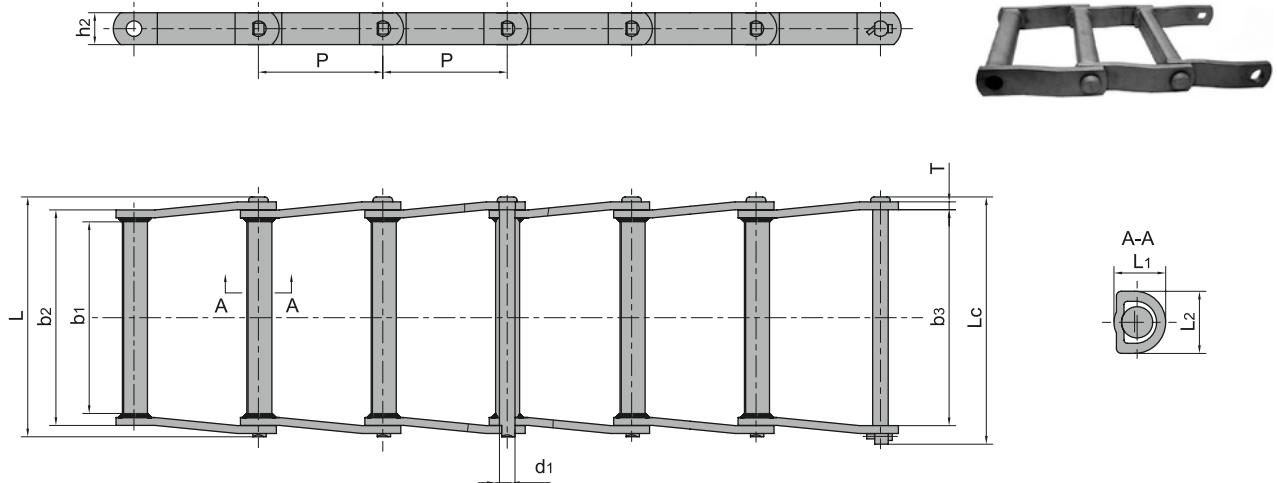

The wide series, WD have all parts heat treated for high wear resistance and thus increase the durability, the pins are riveted as standard and as an option permits reverse barrels. By turning the chain upside down the chain, given the simetric design. Its life may be longer.
